Detailed Product Price Indexes in Tables 4 and 6

The Bureau of Labor Statistics is emphasizing industry-oriented price indexes by placing most newly introduced detailed product indexes in table 4, rather than in table 6, of this publication. This policy should alleviate the confusion caused by indexes for a given product appearing in more than one table.

For further information, see "Changes in Presentation of Detailed Product Price Indexes," on page 6 of *Producer Prices and Price Indexes, Data for July 1982*.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

[2] Data for April 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

[3] Not available.

[4] Prices for all items in this grouping are lagged 1 month.

[5] Regional refined petroleum product prices and price indexes are presented in table 7.

[6] Prices for some items in this grouping are lagged 1 month.

[7] This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

n.e.c. = Not elsewhere classified.

c = corrected.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

Phase-out of the Industry Sector Price Indexes

Effective with the introduction of data for January 1983 from the Producer Price Index Revision (PPIR), selected Industry Sector Price Indexes (ISPI's) will be deleted from tables 9 and 10 of this publication for those industries which also appear in table 4, "Producer price indexes for the net output of selected industries and their products."

The PPIR sample reflected in table 4 is designed as an improvement of, and replacement for, the indexes in tables 9 and 10. The table 4 indexes are based on a large statistical sample of producers and products within the specified industries, while the original samples for the indexes in tables 9 and 10 were smaller, nonstatistical, commodity-oriented samples which were not restricted to the specified industry.

All ISPI's whose movements are currently determined by corresponding series from the Producer Price Index Revision system (as now indicated by an appropriate footnote after their titles in table 9 or 10) will be dropped from these tables next January. Remaining ISPI's will be dropped from these tables at 6-month intervals thereafter, as improved data become available. Tables 9 and 10 will eventually be discontinued; table 4 will be the primary vehicle for releasing industry-oriented price data.

As indexes are deleted from tables 9 and 10, the historical data will be incorporated into the PPIR system. This will be accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes. These rebased historical data will be available later this year upon request.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 3,400 commodities and about 26,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

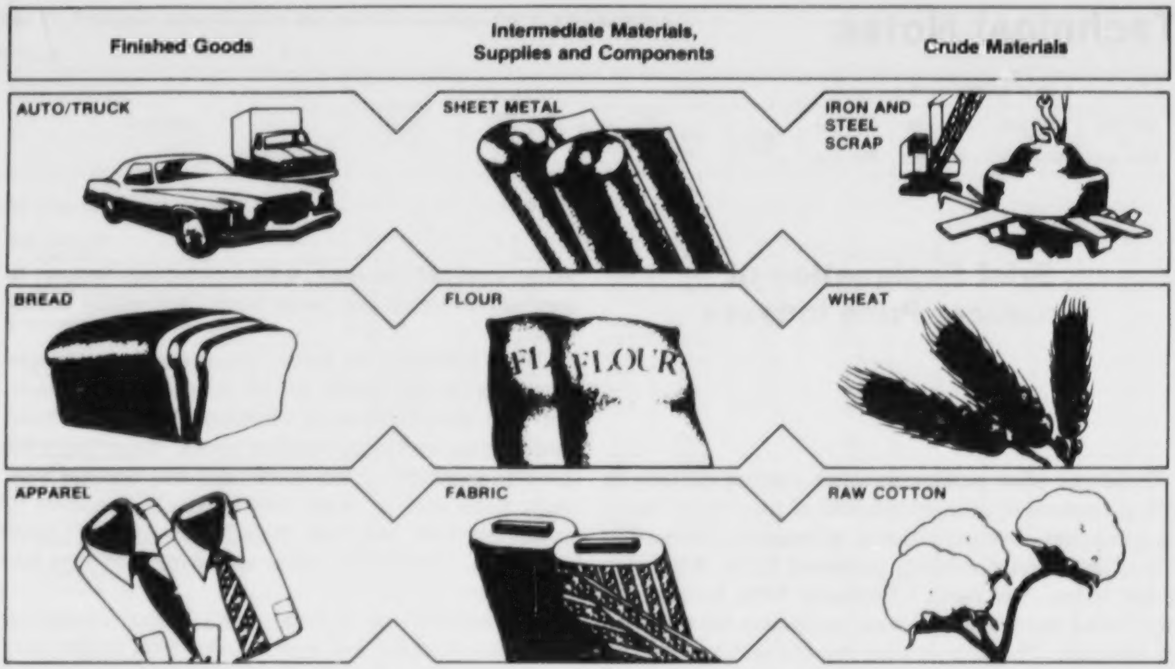
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 9 and 10. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 9, or 10 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 9 or 10 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
September 1982

The Producer Price Index for Finished Goods edged down 0.1 percent from August to September after seasonal adjustment. The index had increased 0.6 percent in both July and August. The index for intermediate goods was virtually unchanged over the month, following a small decline in August. Crude material prices fell 1.5 percent, the fourth consecutive monthly decrease. (See table A.)

The Finished Goods index slowed from a 0.6 percent rise in August to a 0.1 percent decrease in September. About two-thirds of this slowdown was caused by across-the-board inventory liquidation allowances for passenger cars and trucks given to dealers by domestic producers to close out the 1982 model year. The index for finished goods other than foods and energy edged down 0.1 percent, following a 0.6 percent rise in the previous month. A 0.5 percent drop in the index for finished consumer foods also contributed to the September downturn in the Finished Goods index. Consumer food prices, which had climbed through the first half of this year, turned down in the third quarter. The index for finished energy goods rose 0.4 percent, far less than in any of the 3 preceding months.

Before seasonal adjustment, the Producer Price Index for Finished Goods decreased 0.4 percent to 281.4 (1967=100). From September 1981 to September 1982, the Finished Goods Price Index rose 3.6 percent. Over the year, prices for finished consumer foods increased 1.4 percent, the index for finished energy goods edged down 0.1 percent, prices for finished consumer goods other than foods and energy advanced 5.1 percent, and the capital equipment index rose 5.4 percent. The Producer Price Index for intermediate goods inched up 0.3 percent over the year, and crude material prices were 3.4 percent lower than in September 1981.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods edged down 0.1 percent in September on a seasonally adjusted basis. This followed increases of 0.6 percent in both July and August and a 1.0 percent advance in June. The September reversal resulted in part from the index for finished consumer goods other than foods and energy, which was unchanged after 6 months of increases. Substantial declines were registered for passenger cars (6.3 percent) and light motor trucks (3.5 percent), reflecting in large part end-of-model-year allowances to help dealers liquidate inventories. Excluding liquidation allowances, which were first introduced into the PPI in 1980, the index for passenger cars would have fallen 1.8 percent,

[1] Data for May 1982 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

the light motor trucks index would have edged up 0.1 percent, and the Finished Goods index would have risen 0.4 percent. Prices also fell for costume jewelry, tires, cosmetics, and lawnmowers. In contrast, prices jumped 16.8 percent for gold jewelry and 5.3 percent for tobacco products. Prices also rose for apparel, luggage and small leather goods, household flatware, and for electric lamps and bulbs.

The index for finished consumer foods moved down 0.5 percent, after edging up 0.1 percent in August. Prices for pork, processed poultry, and soft drinks turned down after rising in the previous month. Prices fell faster than in August for beef and veal, fresh vegetables, and for processed fruits and vegetables. Prices for shortening and cooking oils fell for the third consecutive month. Prices rose, but less than a month earlier, for fish, fresh fruits, and refined sugar. On the other hand, prices turned up after falling in August for whole black pepper, dairy products, flour base mixes, and roasted coffee.

The index for finished energy goods increased 0.4 percent, much less than in August (1.2 percent), July (5.7 percent), and June (4.2 percent). Gasoline prices turned down after climbing in each of the previous 3 months, and home heating oil prices fell 1.6 percent after edging down in August and rising sharply in each of the 2 months prior to that. Prices for natural gas, however, rose much faster than in August.

Capital equipment. The Producer Price Index for capital equipment fell 0.4 percent; this was the first decline since February, when the index also registered a 0.4 percent drop. The September reversal reflected mainly sharp declines for motor vehicles because of liquidation allowances. There were widespread but modest price fluctuations among other capital goods; only fixed wing utility aircraft (up 1.8 percent) recorded a change over 1 percent.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components was virtually unchanged in September on a seasonally adjusted basis, following a slight dip in August. Decreases in prices for foods and energy offset advances for a variety of other products.

The index for intermediate goods other than foods and energy rose 0.4 percent, after edging down in most earlier months this year. The upturn was led by a 1.0 percent increase in the durable manufacturing materials index, which was in turn dominated by unusually sharp jumps in silver and gold prices. Increases also occurred for zinc, tin, and lead, while prices for copper and flat glass turned down.

The construction materials and components index moved up 0.3 percent, reversing the August decline. Prices advanced for asphalt roofing, wiring devices, environmental controls, and plumbing fixtures and brass fittings. However, lower prices were registered for softwood lumber and for copper wire and cable.

The index for nondurable manufacturing materials edged up 0.1 percent, after decreasing for 8 consecutive months. While prices for leather and plastic resins increased, gray fabrics and paperboard prices fell. In other categories, large advances took place for motor vehicle parts, electric motors, photographic supplies, foamed plastic products, and pesticides. In contrast, prices were lower for laminated plastic sheets.

The intermediate energy goods index decreased 1.4 percent, in the wake of 3 months of increases. Residual fuel prices fell more sharply than in August, and the indexes for gasoline, kerosene, and diesel fuel all turned down following recent advances. On the other hand, price increases for liquefied petroleum gas continued to accelerate.

The intermediate foods and feeds index moved down 1.8 percent. Prices for animal feeds, crude vegetable oils, and animal fats and oils dropped more than in August. In addition, corn syrup prices fell sharply after showing no change for several months.

Crude materials

The Producer Price Index for Crude Materials for Further Processing dropped 1.5 percent on a seasonally adjusted basis, after declines of 1.0 percent in July and 0.6 percent in August. The sharper decrease in September was due to the index for crude foodstuffs and feedstuffs, which fell 3.8 percent, even more than in any of the 3 preceding months. Cattle and corn prices tumbled much more than in other recent months. Prices turned down after rising in August for oilseeds, raw cane sugar, hogs, and cocoa beans. Prices for green coffee and fluid milk also moved down, although not as much as in August. On the other hand, prices turned up for wheat, hay, and live poultry after falling in the previous month.

The index for crude nonfood materials other than energy advanced 1.0 percent, following a 0.6 percent decline in the previous month. After falling in August, prices for copper base scrap jumped 9.6 percent. Cattle hide prices also turned up after declines in each of the previous 2 months. In contrast, prices for cotton, logs and timber, and crude natural rubber continued to fall. Iron and steel scrap, aluminum base scrap, and wastepaper prices turned down after rising in the previous month.

The crude energy materials index increased 1.0 percent, after edging up 0.2 percent in August. Prices for natural gas climbed 2.7 percent, much more than in the preceding month. Coal prices moved up 0.4 percent, and crude petroleum prices were unchanged for the fifth consecutive month.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Availability of Computer Tape for Producer Price Index Revision Data

A subfile computer tape for Producer Price Index Revision (PPIR) indexes is now available to the public for the first time. Previously, only Producer Price Indexes (PPI) and Industry Sector Price Indexes (ISPI) were available on tape. These tapes will continue to be produced separately; however, users are encouraged to acquaint themselves with the PPIR subfile.

The subfile contains every PPIR index which has been published for at least 1 month. Each series will contain all published historical and current PPIR index values and, for those recently introduced PPIR indexes with a corresponding PPI commodity or ISPI historical index, a set of historical PPI/ISPI index values rebased to the PPIR index base date. This creates a continuous data base and will enable users to convert to the PPIR subfile from the PPI subfile.

As new PPIR series are introduced each January and July, they will be added to the subfile. The following May and November, when the originally published January and July PPI/ISPI index values are revised and become final, all historical data from corresponding PPI/ISPI indexes will be rebased and attached to the appropriate PPIR series.

The PPIR subfile may be bought the same way as the PPI subfile. The purchase price is $85. For questions about buying the tape, please contact Brenda Kyle at (202) 523-1075. Questions concerning the contents of the subfile should be referred to Marybeth Tschetter or Peter Kuhmerker at (202) 272-5120.

Detailed Product Price Indexes in Tables 4 and 6

The Bureau of Labor Statistics is emphasizing industry-oriented price indexes by placing most newly introduced detailed product indexes in table 4, rather than in table 6, of this publication. This policy should alleviate the confusion caused by indexes for a given product appearing in more than one table.

For further information, see "Changes in Presentation of Detailed Product Price Indexes," on page 6 of *Producer Prices and Price Indexes, Data for July 1982*.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

[2] Data for May 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

[3] Not available.

[4] Prices for all items in this grouping are lagged 1 month.

[5] Regional refined petroleum product prices and price indexes are presented in table 7.

[6] Prices for some items in this grouping are lagged 1 month.

[7] This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

n.e.c. = Not elsewhere classified.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

Phase-out of the Industry Sector Price Indexes

Effective with the introduction of data for January 1983 from the Producer Price Index Revision (PPIR), selected Industry Sector Price Indexes (ISPI's) will be deleted from tables 9 and 10 of this publication for those industries which also appear in table 4, "Producer price indexes for the net output of selected industries and their products."

The PPIR sample reflected in table 4 is designed as an improvement of, and replacement for, the indexes in tables 9 and 10. The table 4 indexes are based on a large statistical sample of producers and products within the specified industries, while the original samples for the indexes in tables 9 and 10 were smaller, nonstatistical, commodity-oriented samples which were not restricted to the specified industry.

All ISPI's whose movements are currently determined by corresponding series from the Producer Price Index Revision system (as now indicated by an appropriate footnote after their titles in table 9 or 10) will be dropped from these tables next January. Remaining ISPI's will be dropped from these tables at 6-month intervals thereafter, as improved data become available. Tables 9 and 10 will eventually be discontinued; table 4 will be the primary vehicle for releasing industry-oriented price data.

As indexes are deleted from tables 9 and 10, the historical data will be incorporated into the PPIR system. This will be accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes. These rebased historical data will be available later this year upon request.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 3,400 commodities and about 26,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

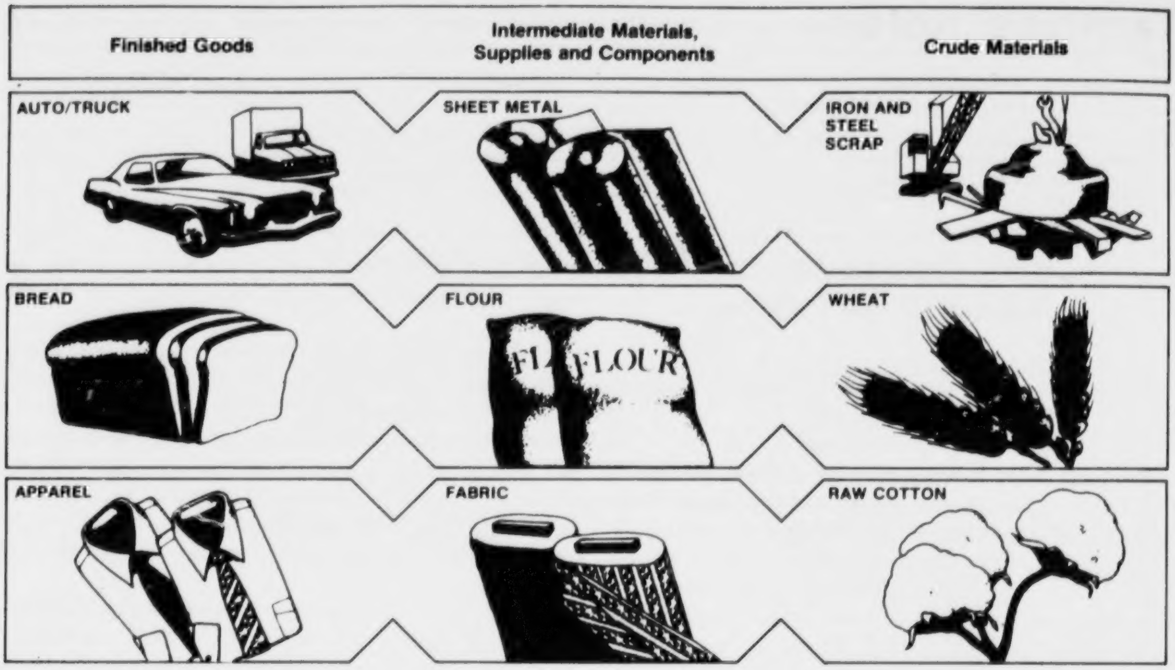
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 9 and 10. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 9, or 10 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 9 or 10 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.).

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

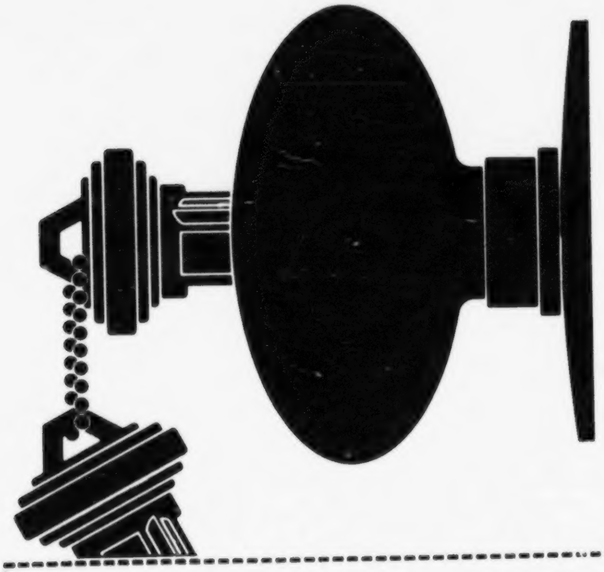
Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Rent or Buy? Evaluating Alternatives in the Shelter Market

U.S. Department of Labor
Bureau of Labor Statistics



"Rent or Buy? Evaluating Alternatives in the Shelter Market" helps a person or family compare the financial aspects of owning and renting shelter suited to their needs. A step-by-step procedure for making the comparison is outlined and fully illustrated. Space is provided to help determine:

- The monthly outlay to own a house of your choosing before and after tax saving from homeownership.
- The proceeds if you were to sell the house after a given period of time.
- The amount you can spend for rent and be as well-off financially after a given period of time as if you bought.

The pamphlet, first issued in 1974, has been updated to depict more recent economic conditions that affect shelter decisions.

Price Movements
October 1982

The Producer Price Index for Finished Goods rose 0.5 percent on a seasonally adjusted basis from September to October. Following a slight decline in September caused by end-of-model-year auto discounts, the October increase of 0.5 percent was about the same as the 0.6 percent advances in July and August. The index for intermediate goods edged down 0.2 percent; it declined slightly in August and was unchanged in September. The crude materials index dropped 0.7 percent, the fifth consecutive monthly decrease. (See table A.)

Most of the October advance in the Finished Goods index was due to increases in prices for passenger cars and trucks. In September, domestic producers closed out the 1982 model year with unusually large discounts; higher prices for 1983 models are reflected in the October index. Price indexes for finished consumer foods and energy goods both edged down in October.

Before seasonal adjustment, the Producer Price Index for Finished Goods advanced 1.0 percent to 284.1 (1967 = 100). Over the year from October 1981 to October 1982, the Finished Goods Price Index moved up 3.6 percent. Prices for finished consumer foods rose 1.5 percent over the year, finished energy goods prices in October 1982 were virtually the same as in October 1981, the index for finished consumer goods other than foods and energy increased 5.2 percent, and capital equipment prices were up 4.5 percent. The index for intermediate goods was 0.2 percent higher than in October 1981, while crude material prices decreased 2.4 percent over the year.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods advanced 0.5 percent (after seasonal adjustment) in October, after edging down 0.1 percent in September. The upturn was caused primarily by an increase of 1.1 percent from September to October in the index for finished consumer goods other than foods and energy, which showed no change from August to September. Prices increased for both passenger cars (4.1 percent) and light motor trucks (6.7 percent) as domestic producers instituted price hikes for 1983 model year vehicles. (See "Quality Changes for 1983 Model Passenger Cars," page 4.) Since October 1981, the indexes for passenger cars and light motor trucks increased 2.6 and 1.7 percent, respectively. Prices for tobacco products climbed even more sharply (11.8 percent) than in the previous month (5.3 percent).

[1] Data for June 1982 have been revised to reflect the availability of late reports and corrections by respondents. For this reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

Prices also rose for lawnmowers, drugs, electric lamps and bulbs, silver jewelry, and household flatware. In contrast, prices fell more than in September for cosmetics and for sporting and athletic goods. Prices turned down after rising in September for mobile homes, textile housefurnishings, gold jewelry, small arms and ammunition, and cutlery.

The index for finished energy goods edged down 0.1 percent, following 4 months of increases. Natural gas prices decreased 0.9 percent, after a 2.7 percent rise in September. Gasoline prices fell more than a month earlier. On the other hand, home heating oil prices rose after declining in each of the 2 previous months.

The index for finished consumer foods moved down 0.2 percent, less than the 0.5 percent drop in September. Prices turned up sharply after falling a month earlier for fresh vegetables, eggs, and processed poultry. Roasted coffee prices rose more than in September. In contrast, prices fell more in the previous month for pork and for beef and veal. Prices turned down for fresh fruits and flour base mixes after rising in September. Fish prices rose but less than a month earlier.

Capital equipment. The Producer Price Index for capital equipment moved up 0.2 percent, after declining 0.4 percent in the preceding month. Much of the reversal was due to an upturn in the index for motor vehicles, as 1983 models were introduced. Prices for agricultural machinery climbed 1.4 percent after edging up 0.1 percent in September. In contrast, prices declined for photographic equipment, fixed wing utility aircraft, and for oilfield and gasfield machinery.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components moved down 0.2 percent seasonally adjusted in October, after showing no change in the previous month. The durable manufacturing materials index fell 0.8 percent in the wake of a 1.0 percent jump in September that was primarily due to sharp hikes for precious metals. October prices were lower for copper, gold, lead, and several types of steel mill products. Hot rolled steel sheet and strip, aluminum, and silver registered moderate increases.

The index for nondurable manufacturing materials declined 0.7 percent, resuming the downward trend exhibited earlier in the year. Prices fell for woodpulp, paper, paperboard, industrial chemicals, synthetic fibers, and inedible fats and oils. However, increases occurred for leather and for medicinal and botanical chemicals.

The construction materials and components index rose 0.3 percent for the second consecutive month, led by advances for asphalt roofing and paving mixtures, concrete products, and environmental controls. Decreases were recorded, however, for plywood, nonferrous wire and cable, and fabricated structural metal products.

The intermediate energy index edged down 0.1 percent, following a more sizable decline in September. Although liquefied petroleum gas prices continued to move up rapidly, prices for electric power, gasoline, and lubricating oil materials fell. The intermediate foods and feeds index continued to decrease, primarily because of lower prices for animal feeds and refined sugar. Crude vegetable oil prices turned up sharply after 4 months of substantial declines. In other categories, lower prices were registered for metal containers, mechanical power transmission equipment, and mixed fertilizers. Prices for photographic supplies rose only slightly following 5 months of much larger advances.

Crude materials

The Producer Price Index for Crude Materials for Further Processing moved down 0.7 percent on a seasonally adjusted basis, within the range of decreases in each month since June. The decline in October was due to the index for foodstuffs and feedstuffs, which fell 1.9 percent, the fifth consecutive large monthly drop. Prices for hogs dropped sharply, and cattle prices decreased rapidly for the fourth consecutive month, although much less than in September. After rising sharply in September, prices for wheat, live poultry, and hay declined. Corn and raw cane sugar prices also fell but much less than in the preceding month. Price indexes for oilseeds and cocoa beans rose after large decreases in September.

The index for crude nonfood materials other than energy showed no change, following an advance of 1.0 percent in the previous month. Prices for logs and timber, iron and steel scrap, and crude natural rubber moved down more than in the preceding month. After rising in September, prices for cattle hides and copper base scrap turned down. In contrast, raw cotton prices moved up after falling sharply in August and September. Prices for aluminum base scrap also turned up after falling in the previous month.

The crude energy materials index rose 0.8 percent, following a 1.0-percent increase in September. Prices for crude petroleum climbed 2.4 percent; they had shown virtually no change in any of the 5 preceding months. In contrast, natural gas prices turned down somewhat after advancing for 8 consecutive months.

Quality Changes for 1983 Model Passenger Cars

The value of quality changes for the 1983 model domestic passenger cars included in the Producer Price Index averaged $107.66 at the manufacturing level and $128.04 at the retail level. The estimates represent about 49.9 percent of the average increase of $215.55 in producers' prices and about 48.5 percent of the average increase of $263.92 in manufacturers' suggested list prices.

These estimates are based on a review by BLS of data supplied by automobile producers for 19 similarly equipped 1982 and 1983 model domestic cars priced in the Consumer and Producer Price Indexes. These estimates of quality change are also used in the Producer Price Index for October, when most of the new model year cars are introduced. The estimates of quality change are also used in the Consumer Price Index starting in October.

The $128.04 estimated retail value of the quality change breaks down as follows:

— $64.65 for changes to improve fuel economy and to reduce emissions in accordance with current and anticipated Federal standards.

— $63.39 for other changes not related to fuel economy or air quality standards such as changes for improved warranties and for improved corrosion protection.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Availability of Computer Tape for Producer Price Index Revision Data

A subfile computer tape for Producer Price Index Revision (PPIR) indexes is now available to the public for the first time. Previously, only Producer Price Indexes (PPI) and Industry Sector Price Indexes (ISPI) were available on tape. These tapes will continue to be produced separately; however, users are encouraged to acquaint themselves with the PPIR subfile.

The subfile contains every PPIR index which has been published for at least 1 month. Each series will contain all published historical and current PPIR index values and, for those recently introduced PPIR indexes with a corresponding PPI commodity or ISPI historical index, a set of historical PPI/ISPI index values rebased to the PPIR index base date. This creates a continuous data base and will enable users to convert to the PPIR subfile from the PPI subfile.

As new PPIR series are introduced each January and July, they will be added to the subfile. The following May and November, when the originally published January and July PPI/ISPI index values are revised and become final, all historical data from corresponding PPI/ISPI indexes will be rebased and attached to the appropriate PPIR series.

The PPIR subfile may be bought the same way as the PPI subfile. The purchase price is $85. For questions about buying the tape, please contact Brenda Kyle at (202) 523-1075. Questions concerning the contents of the subfile should be referred to Marybeth Tschetter or Peter Kuhmerker at (202) 272-5120.

Detailed Product Price Indexes in Tables 4 and 6

The Bureau of Labor Statistics is emphasizing industry-oriented price indexes by placing most newly introduced detailed product indexes in table 4, rather than in table 6, of this publication. This policy should alleviate the confusion caused by indexes for a given product appearing in more than one table.

For further information, see "Changes in Presentation of Detailed Product Price Indexes," on page 6 of *Producer Prices and Price Indexes, Data for July 1982*.

Phase-out of the Industry Sector Price Indexes

Effective with the introduction of data for January 1983 from the Producer Price Index Revision (PPIR), selected Industry Sector Price Indexes (ISPI's) will be deleted from tables 9 and 10 of this publication for those industries which also appear in table 4, "Producer price indexes for the net output of selected industries and their products."

The PPIR sample reflected in table 4 is designed as an improvement of, and replacement for, the indexes in tables 9 and 10. The table 4 indexes are based on a large statistical sample of producers and products within the specified industries, while the original samples for the indexes in tables 9 and 10 were smaller, nonstatistical, commodity-oriented samples which were not restricted to the specified industry.

All ISPI's whose movements are currently determined by corresponding series from the Producer Price Index Revision system (as now indicated by an appropriate footnote after their titles in table 9 or 10) will be dropped from these tables next January. Remaining ISPI's will be dropped from these tables at 6-month intervals thereafter, as improved data become available. Tables 9 and 10 will eventually be discontinued; table 4 will be the primary vehicle for releasing industry-oriented price data.

As indexes are deleted from tables 9 and 10, the historical data will be incorporated into the PPIR system. This will be accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes. These rebased historical data will be available later this year upon request.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

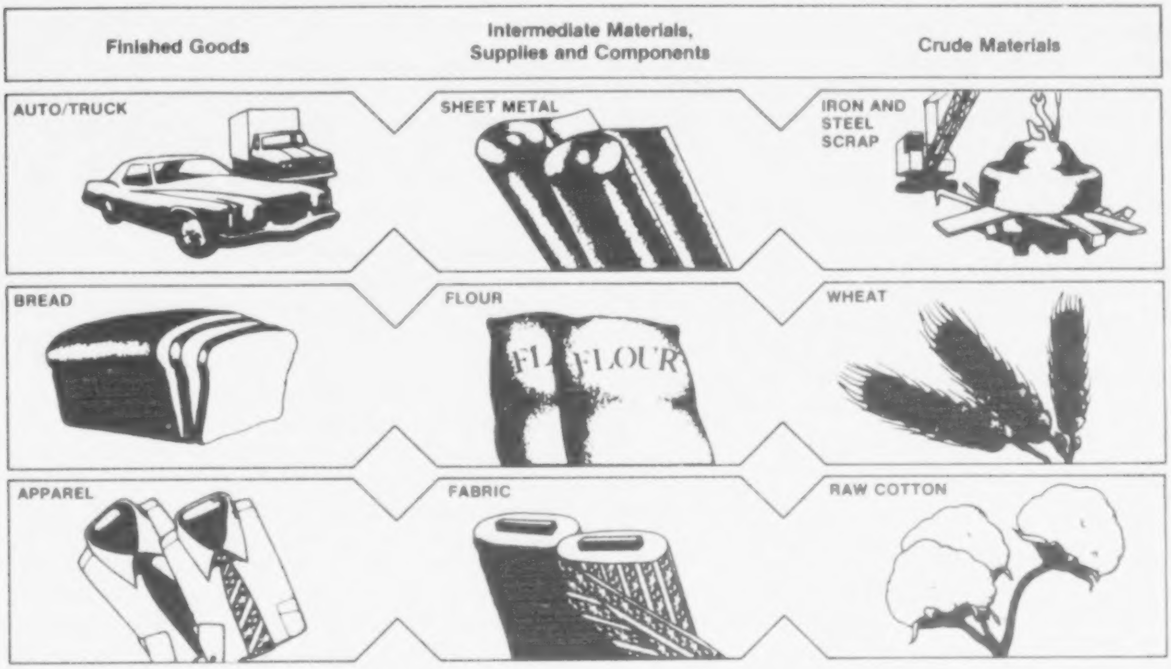
Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices



generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 9 and 10. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 9, or 10 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 9 or 10 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
November 1982

The Producer Price Index for Finished Goods rose 0.6 percent on a seasonally adjusted basis from October to November. The November increase was about the same as it was in 3 of the 4 preceding months. The index for intermediate goods moved up 0.5 percent, following a small decline in October and virtually no change in either August or September. After falling for 5 consecutive months, crude material prices climbed 0.9 percent. Higher energy prices were a major factor at all three stages of processing. (See table A.)

Among finished goods, the index for finished energy goods advanced sharply, after a small rise in September and a slight drop in October. This acceleration was largely balanced by a substantial slowdown in price increases for finished consumer goods other than foods and energy. As in October, capital equipment prices rose slowly and consumer food prices edged down.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.3 percent to 284.9 (1967=100). Over the year from November 1981 to November 1982, the Finished Goods Price Index moved up 3.7 percent. Prices for finished consumer foods rose 1.9 percent over the year, finished energy goods prices in November 1982 were 1.6 percent higher than in November 1981, the index for finished consumer goods other than foods and energy increased 5.0 percent, and capital equipment prices were up 4.0 percent. The index for intermediate goods was 0.4 percent higher than in November 1981, while crude material prices edged down 0.2 percent over the year.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 0.8 percent seasonally adjusted in November, following a 0.5 percent advance in October. The index for finished energy goods climbed 2.9 percent, after edging down 0.1 percent a month earlier. The natural gas index turned up markedly after declining in October, and the gasoline index also turned up (after seasonal adjustment). The index for home heating oil prices advanced 6.4 percent, following a 1.0 percent rise in the previous month.

The index for finished consumer goods other than foods and energy increased 0.5 percent, about the same as the average monthly increase over the previous 2 months. Prices for passenger cars and light motor trucks showed little or no change after rising in October. In

addition, prices declined somewhat in November for gold jewelry and home electronic equipment. On the other hand, prices for cosmetics and sanitary papers turned up sharply following October decreases; prices for costume jewelry, books, and detergents also rose substantially.

The index for finished consumer foods moved down 0.2 percent, the same as in October. Sharp declines were registered for pork (3.9 percent), eggs (12.8 percent), and milled rice (8.3 percent). Prices also dropped for fish, processed poultry, and whole black pepper. Prices rose, however, for fresh fruits, candy bars, and bakery products.

Capital equipment. The Producer Price Index for capital equipment moved up 0.3 percent in November, compared with a rise of 0.2 percent a month earlier. The largest increases in November were for rubber working machinery, food products machinery, and for integrating and measuring instruments. On the other hand, prices declined for agricultural machinery and for pumps and compressors. Prices for motor vehicles were virtually unchanged after rising in October.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 0.5 percent in November on a seasonally adjusted basis, after edging down in October. The November upturn was the result of the absence of seasonal price declines for several products, combined with higher energy prices.

The index for intermediate materials excluding food and energy moved up 0.2 percent, after edging down 0.1 percent in the previous month. The durable manufacturing materials index advanced 0.6 percent, as prices for copper, silver, and flat glass registered increases. However, gold, lead, and zinc prices fell.

The nondurable manufacturing materials index rose 0.3 percent, after declining in most months this year. Advances for synthetic fibers and leather were partly offset by lower prices for industrial chemicals, paper, fabrics, and fertilizer materials.

The index for construction materials and components edged up 0.1 percent. Although prices were higher for asphalt paving mixtures, plywood, plastic construction products, and building brick, the indexes for asphalt roofing and environmental controls recorded declines. In miscellaneous categories, prices increased for electronic components, electric motors, and mining machinery parts. However, mixed fertilizer and wood chip prices fell.

The intermediate energy goods index advanced 1.6 percent, following 3 months of relative weakness. Large increases took place for residual fuel, diesel fuel, kerosene, and liquefied petroleum gas. Although prices for electric power and gasoline continued to decline, these decreases were smaller than seasonal; as a result, seasonally adjusted indexes for these products rose moderately. Lubricating oil materials prices continued to fall substantially.

The intermediate foods and feeds index moved down 0.3 percent, the sixth consecutive monthly decrease. Prices fell sharply for crude vegetable oils, animal fats and oils, and confectionery materials. However, animal feed prices rebounded after several months of downward movements.

Crude materials

The Producer Price Index for Crude Materials for Further Processing advanced 0.9 percent, after declining 0.7 percent in October. The upturn was due to higher prices for farm products and natural gas. The index for crude foodstuffs and feedstuffs rose 1.0 percent; in contrast, this index had decreased an average of 2.1 percent per month during the 5 previous months. Prices for corn rebounded with a 13.5 percent upsurge after falling sharply since spring. Prices for live poultry and raw cane sugar also turned up after falling in October, and oilseed prices climbed sharply after edging up in the preceding month. Prices for hogs and hay declined substantially, although not as much as in October. Prices for green coffee and cocoa beans also fell rapidly.

The crude energy materials index rose 1.7 percent, considerably more than in other recent months. Natural gas prices climbed 5.0 percent, more than in any month since February 1980. In contrast, crude petroleum prices edged down, following a sizable jump in October.

The index for crude nonfood materials other than energy moved down 1.3 percent, after showing no change in the previous month. Prices for iron and steel scrap plummeted 8.2 percent, following much smaller decreases in September and October. Wastepaper prices also moved down more than in either of the 2 preceding months, and prices for raw cotton and aluminum base scrap turned down after increasing in October. In contrast, crude natural rubber and cattle hide prices rose considerably after falling sharply in October.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Availability of Computer Tape for Producer Price Index Revision Data

A subfile computer tape for Producer Price Index Revision (PPIR) indexes is now available to the public for the first time. Previously, only Producer Price Indexes (PPI) and Industry Sector Price Indexes (ISPI) were available on tape. These tapes will continue to be produced separately; however, users are encouraged to acquaint themselves with the PPIR subfile.

The subfile contains every PPIR index which has been published for at least 1 month. Each series will contain all published historical and current PPIR index values and, for those recently introduced PPIR indexes with a corresponding PPI commodity or ISPI historical index, a set of historical PPI/ISPI index values rebased to the PPIR index base date. This creates a continuous data base and will enable users to convert to the PPIR subfile from the PPI subfile.

As new PPIR series are introduced each January a
July they will be added to the subfile. The followi
May and November, when the originally publish
January and July PPI/ISPI index values are revis
and become final, all historical data from correspon
ing PPI/ISPI indexes will be rebased and attached
the appropriate PPIR series.

The PPIR subfile may be bought the same way as
PPI subfile. The purchase price is $85. For questio
about buying the tape, please contact Brenda Kyle
(202) 523-1072. Questions concerning the contents
the subfile should be referred to Marybeth Tschetter
Peter Kolmonskey at (202) 272-5129.

Detailed Product Price Indexes in Tables 4 and 6

The Bureau of Labor Statistics is emphasizing industry-oriented price indexes by placing most newly introduced detailed product indexes in table 4, rather than in table 6, of this publication. This policy should alleviate the confusion caused by indexes for a given product appearing in more than one table.

For further information, see "Changes in Presentation of Detailed Product Price Indexes," on page 6 of *Producer Prices and Price Indexes, Data for July 1982*.

Phase-out of the Industry Sector Price Indexes

Effective with the introduction of data for January 1983 from the Producer Price Index Revision (PPIR), selected Industry Sector Price Indexes (ISPI's) will be deleted from tables 9 and 10 of this publication for those industries which also appear in table 4, "Producer price indexes for the net output of selected industries and their products."

The PPIR sample reflected in table 4 is designed as an improvement of, and replacement for, the indexes in tables 9 and 10. The table 4 indexes are based on a large statistical sample of producers and products within the specified industries, while the original samples for the indexes in tables 9 and 10 were smaller, nonstatistical, commodity-oriented samples which were not restricted to the specified industry.

All ISPI's whose movements are currently determined by corresponding series from the Producer Price Index Revision system (as now indicated by an appropriate footnote after their titles in table 9 or 10) will be dropped from these tables next January. Remaining ISPI's will be dropped from these tables at 6-month intervals thereafter, as improved data become available. Tables 9 and 10 will eventually be discontinued; table 4 will be the primary vehicle for releasing industry-oriented price data.

As indexes are deleted from tables 9 and 10, the historical data will be incorporated into the PPIR system. This will be accomplished by rebasing the old indexes to the base period of the corresponding PPIR indexes. These rebased historical data will be available later this year upon request.
